

## WEEKLY TEST TYM-02 TEST - 8 RAJPUR ROAD SOLUTION Date 22-09-2019

## [PHYSICS]

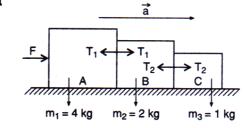

1. According to free body diagram of block A,

$$F - T_1 = m_1 a$$
  
 $T_1 - T_2 = m_2 a$   
 $T_2 = m_3 a$ 

....(ii) ....(iii)

Addding all the three eqns., we get

$$F = (m_1 + m_2 + m_3)a$$
 or  $a = \frac{F}{m_1 + m_2 + r}$ 

$$=\frac{14}{4+2+1}$$

Putting in eqn. (i), contact force between A and B is

$$T_1 = F - m_1 a = 14 - 4 \times 2 = 6 N$$

Hence, correct option is (a)

2. Time periof of a simple pendulum is given:

$$T = 2\pi \sqrt{\frac{I}{g}} \quad \text{or } T \propto \sqrt{\frac{I}{g}}$$

When the elevator is accelerating downwards, then net gravitational acceleration is (g - a). So, the time period when elevator is accelerating downwards, is greatest.

3. As per Newton's third law of motion, when a horse pulls a wagon, the force that causes the horse to move forward is the force the ground exerts on it.

$$4. \hspace{1cm} F = \frac{d}{dt}(Mv) = v \frac{dM}{dt} + M \frac{dv}{dt}$$

As v is a constant, 
$$F = v \frac{dM}{dt}$$

But 
$$\frac{dM}{dt} = M \text{ kg/s}$$

∴ To keep the conveyer belt moving at v m/s, Force needed = vM newton

:. Acceleration is 4 ms<sup>-2</sup> upwards

7. Considering free-body diagrams of the masses, we have T - 3g = 3a and 5g - T = 5a Solving for T, we have

$$T = (15/4)g$$

 $\therefore$  F = Force on the pulley

$$= 2T = 2 \times \frac{15}{4} = 7.5 \text{ kg f}$$

Change in momentum in one sec, i.e., 8.

F = change in momentum per bullet x no. of bullets fired per second

 $= mv \times n = mnv$ 

- $T_2 = \frac{6}{6+6+6}F = \frac{F}{3}$ 9.
- For a body to the equilibrium, it should exist both in translational equilibrium. 10. For translational equilibruim,  $\Sigma F = 0$

and for rotational equilibrium,  $\Sigma \tau = 0$ 

- Acceleration of the mass  $m_3$  = common acceleration of the system =  $\frac{F}{\text{total mass}} = \frac{F}{m_1 + m_2 + m_2}$ 11.
- One of the weights given a reading and the other prevents the acceleration of the styem. Therefore, the 12. reading is not zero but 10 N.
- 13. Equations of motion are:

$$F - T_1 = 2a$$
  
 $T_1 - T_2 = 3a$   
 $T_2 = 5a$ 

$$T_{a}^{1} = 5a^{2}$$

Adding all above equations, we get;

$$F = 10a = 10 \times 1 = 10 N$$

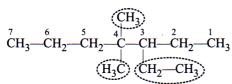

- The tension in the string between P and Q accelerates double the mass as compared to that between A 14. and R. Hence, tension between P and Q = 2 x tension between Q and R
- $T \cos\theta = T_1 = 10 \times g$ 15.

 $T \sin\theta = 98$ 

$$\therefore \quad \tan \theta = \frac{98}{10 \times 9.8} = 1 \quad \text{or} \quad \theta = 45^{\circ}$$

## [CHEMISTRY]

16. 17.

3-Ethyl-4, 4-dimethylheptane

18.

$$HC = \frac{2}{C} - \frac{3}{C}H = \frac{4}{C}H - \frac{5}{C}H_3$$

19.

20.

The compound can be expanded as

$$\begin{array}{c} H & \overset{5}{\text{CH}}_{2} - \overset{6}{\text{CH}}_{2} - \overset{7}{\text{CH}}_{2} - \overset{8}{\text{CH}}_{3} \\ \overset{1}{\text{CH}}_{3} - \overset{2}{\text{CH}}_{2} - \overset{3}{\text{C}} - \overset{4}{\text{C}} - \overset{4}{\text{C}} - \overset{4}{\text{C}} - \overset{4}{\text{C}} \\ & \overset{1}{\text{CH}}_{3} - \overset{2}{\text{CH}}_{3} \end{array}$$

IUPAC name is 3, 4, 4-trimethyloctane.

21.

**3, 3-Dimethyl cyclohexan-1-ol** is the proper IUPAC name as per 1993 rules. The given answer is as per the old IUPAC rules, still prevalent.

22.

Cl
$$(Preference to > C = C < )$$
Br

3-Bromo-1-chlorocyclohexene

23.

3-Chloro-4-fluoro-3, 4-dimethylhexane

24.

Butane-1,2, 4-tricarboxylic acid

25.

3,3-Dimethylbutanoyl chloride

26.

27.

2-Carbamoylethanoic acid

28.

$$(\overset{3}{\text{CH}_3} - \overset{2}{\text{CH}_2} - \overset{1}{\text{CH}_2}) \overset{2}{\overset{2}{\text{CH}}} - \overset{1}{\overset{1}{\text{COOH}}}$$

2-(Prop-1-yl) propane-1, 3-dioic acid

29.

$$CloC - CH_2 - CH_2 - COCl$$
 $CH_2 - COCl$ 

3 - (Chloroformylmethyl) pentane-1, 5-dioyl chloride

30.

3-Phenylprop-2-enoic acid

Its trivial name is cinnamic acid.
