

WEEKLY TEST TYM -01 TEST - 14 SOLUTION Date 21-07-2019

[PHYSICS]

1.

Because the body is revolving in a circle with constant speed, hence acceleration acting on it is exactly perpendicular to direction of its motion, *i.e.*, the body possesses normal acceleration.

2.

Because the particle moving in a circle describes equal angles in equal times, hence both ω and r are constant. Thus, magnitude of velocity vector remains constant but the direction changes from point to point.

3.

Acceleration =
$$\omega^2 r = (2\pi f)^2 r = 4\pi^2 f^2 r$$

= $4\pi^2 \times 1 \times (2 \times 10^4) = 8 \times 10^5 \text{m/s}^2$.

4.

Displacement, velocity and acceleration change continuously with respect to time because of change in direction.

5.

The required retardation is given by:

$$a = \frac{v^2}{2x} = \frac{20 \times 20}{2 \times 20} = 10 \text{ m s}^{-2}$$

The centripetal acceleration required to describe a circle of radius 20 m is,

$$\frac{v^2}{R} = \frac{20 \times 20}{20} = 20 \text{ m s}^{-2}$$

Thus, it is better to apply the brakes.

6.

In circular motion, centripetal force acting on the body is always perpendicular to the velocity vector or displacement vector. Hence, work done $(= \vec{F} \cdot \vec{d})$ is always zero whatever may be the displacement along the circular path.

7.

Because the particle is moving in a circle with uniform speed, hence kinetic energy $\left(=\frac{1}{2}mv^2\right)$ will

remain constant. Acceleration, velocity and displacement will change from point to point due to change in direction.

8.

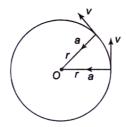

Acceleration of a point at the tip of the blade

= centripetal acceleration =
$$\omega^2 R = (2\pi f)^2 R$$

$$= \left(2 \times \frac{22}{7} \times \frac{1200}{60}\right)^2 \times \frac{30}{100} = 4740 \,\text{m/sec}^2$$

9. 10.

> In a uniform circular motion, the acceleration is directed towards the centre while velocity is acting tangentially.

11.

$$r = 25 \times 10^{-2} \text{ m}, f = 2 / \text{sec}$$

$$\omega = 2\pi f = 4\pi \text{ rad/sec}$$
Acceleration = $\omega^2 r = (4\pi)^2 \times 25 \times 10^{-2}$

$$= 16 \times 25 \times 10^{-2} \pi^2 \text{ m/s}^2$$

$$= 4\pi^2 \text{ m/s}^2$$

12.

Tangential acceleration, $a_t = r\alpha = 4 \text{ m/s}^2$.

Radial acceleration

$$a_t = \omega^2 r = \frac{v^2}{r} = \frac{60 \times 60}{1200} = 3 \text{ m/s}^2$$

Hence, resultant acceleration of the car

$$a = \sqrt{a_t^2 + a_r^2} = \sqrt{4^2 + 3^2} = 5 \text{ m/s}^2$$

13.

For a particle performing uniform circular motion, magnitude of the acceleration remains constant.

Here,
$$v = 27 \text{ km h}^{-1} = 27 \times \frac{5}{18} \text{ms}^{-1}$$

 $v = \frac{15}{2} = 7.5 \text{ ms}^{-1}$

Centripetal acceleration, $a_c = \frac{v^2}{r}$

$$a_c = \frac{(7.5 \text{ ms}^{-1})^2}{80 \text{ m}} = 0.7 \text{ ms}^{-2}$$

Tangential acceleration, $at = 0.5 \text{ m s}^{-2}$

Magnitude of the net acceleration is

$$a = \sqrt{(a_c)^2 + (a_t)^2} = \sqrt{(0.7)^2 + (0.5)^2} = 0.86 \text{ ms}^{-2}$$

15.

The change in velocity when the particle completes half revolution is given by

$$\Delta v = 5 \text{ m/s} - (-5 \text{ m/s}) = 10 \text{ m/s}$$

Time taken to complete half revolution

$$t = \frac{\pi r}{v} = \frac{\pi \times 5}{5} = \pi \sec \theta$$

Average acceleration =
$$\frac{\Delta v}{t} = \frac{10}{\pi} \text{m/s}^2$$

[CHEMISTRY]

$$16. \qquad \quad \frac{1}{\lambda} = RZ^2 \Bigg[\frac{1}{n_1^2} - \frac{1}{n_2^2} \Bigg] = R \times 2^2 \Bigg[\frac{1}{1^2} - \frac{1}{2^2} \Bigg]$$

$$\Rightarrow$$
 3R; $\lambda = \frac{1}{3R}$

17. For hydrogen atom

$$\frac{1}{\lambda} = R_H \left[\frac{1}{n_1^2} - \frac{1}{n_2^2} \right];$$

 $\lambda = 2170 \text{ nm} = 2170 \times 10^{-9} \text{ m};$

$$R_H = 1.09677 \times 10^7 \times m^{-1}$$

$$\therefore \quad \frac{10^9}{2170} = 1.09677 \times 10^7 \left[\frac{1}{n_1^2} - \frac{1}{7^2} \right]; \qquad \quad n_1 = 4$$

So, electron transition from n = 7 to n = 4 will produce infrared light of wavelength 2170 nm.

18. 19.

20.

$$21. \hspace{1.5cm} v = \frac{h}{mv} = \frac{6.63 \times 10^{-34}}{10^{-6} \times 10} = 6.63 \times 10^{-29} \ m$$

22.

23. The ionic radii follow the order : $C^{4-} > N^{3-} > O^{2-}$ and therefore, N^{3-} would have value between 2.60 and 1.40 Å.

24. 25.

26.

27. 28.

- 29. The configuration corresponds to that of CI, which has the highest negative electron gain enthalpy.
- 30. The general electronic configuration of d-block elements is $(n-1)d^{1-10}$, ns^{1-2} . They show variable oxidation state because d-electrons also take part in bond formation. They have take part in bond formation. They have degenerated orbitals. s and p-block elements in general do not show variable oxidation states.
